

Component Demos with Storybook

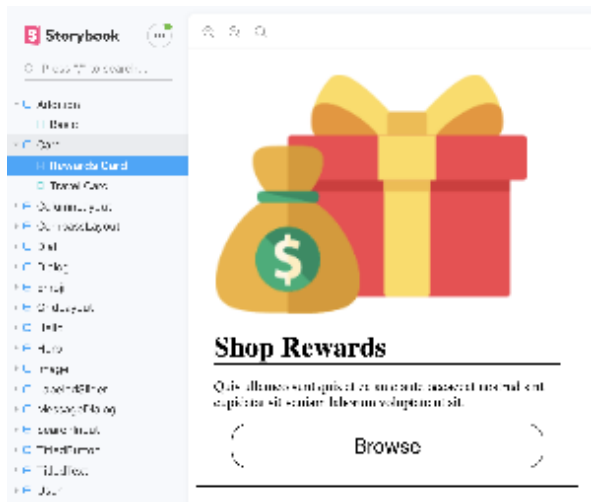

Storybook provides a way to demonstrate the use of each component in a web application. It allows manually testing of a component without having to navigate to where it is used in a real app.

Components in the grp-consumer-web-ui project are defined in the components/src directory.

Storybook stories for these components are defined in the components/src/stories directory.

Use of app state is supported by the call to addDecorator in components/.storybook/config.js.

To run Storybook for this project, cd to the components directory, enter "npm install" (if not already done), and enter "npm run storybook".

The left nav. provides the name of each component. Clicking a component name opens a subtree of variations. These typically render the component with different sets of prop values.
